

Safety Partition Solutions

Safety partitions can be easily installed to create temporary walls or dividers to protect drivers, patients, medical staff and more in situations where being in close proximity with others is unavoidable. For example, in temporary medical facilities that are not equipped with separate patient rooms, solid safety partitions can provide privacy while also reducing exposure to other patients. Additionally, ride share companies that operate as essential business can protect both their drivers and passengers by installing clear safety partitions between the front and back seats.
